10.3. Physical Installation - Outward Opening
FAST TRACK Mechanical Setup

These quick steps are for the experienced installer who needs a checklist to get a standard installation up and running in the minimum amount of time.

Detailed installation features and functions are referred to later on in this manual.

**STEP 1** Gather Required Tools and Equipment

**STEP 2** Heed Necessary Site Considerations

**STEP 3** Determine Installation Type
- Inward Opening Installation
- Outward Opening Installation

**STEP 4** Check Cabling Requirements

**STEP 5** Determine the Gate Swing Angle

**STEP 6** Mount the Gate and Wall Bracket(s)

**STEP 7** Install Operator

**STEP 8** Mount Controller Enclosure
ATTENTION

To ensure the safety of people and possessions, it is important that you read all the following instructions.

Incorrect installation or incorrect use of the product could cause serious harm to people and pets.

The installer, being either professional or DIY, is the last person on the site who can ensure that the operator is safely installed, and that the whole system can be operated safely.

Warnings for the Installer

CAREFULLY READ AND FOLLOW ALL INSTRUCTIONS before beginning to install the product.

- All installation, repair, and service work to this product must be done by a suitably qualified person
- Do not activate your gate opener unless you can see it and can determine that its area of travel is clear of people, pets, or other obstructions
- **NO ONE MAY CROSS THE PATH OF A MOVING GATE.** Always keep people and objects away from the gate and its area of travel
- **NEVER LET CHILDREN OPERATE OR PLAY WITH THE GATE CONTROLS,** and do not allow children or pets near the gate area
- Secure all easily-accessed gate opener controls in order to prevent unauthorised use of the gate
- Do not in any way modify the components of the automated system
- Do not install the equipment in an explosive atmosphere: the presence of flammable gas or fumes is a serious danger to safety
- Before attempting any work on the system, switch off electrical power and disconnect the batteries
- The mains power supply of the automated system must be fitted with an all-pole switch with contact opening distance of 3mm or greater. Use of a 5A hydraulic breaker with all-pole circuit break is recommended
- Make sure that an earth leakage circuit breaker with a threshold of 30mA is fitted upstream of the system
- Never short-circuit the battery and do not try to recharge the batteries with power supply units other than that supplied with the product, or manufactured by Centurion Systems (Pty) Ltd
- Make sure that the earthing system is correctly constructed, and that all metal parts of the system are suitably earthed
• Safety devices must be fitted to the installation to guard against mechanical movement risks such as crushing, dragging and shearing
• It is recommended that at least one warning indicator light be fitted to every system
• Always make sure that the warning signs are fitted so that they are visible from inside and outside of the gate
• The installer must explain and demonstrate the manual operation of the gate in the case of an emergency, and must hand the User/Warnings guide over to the user
• The installer must explain these safety instructions to all persons authorised to use this gate, and be sure that they understand the hazards associated with automated gates
• Do not leave packing materials (plastic, polystyrene, etc.) within reach of children as such materials are potential sources of danger
• Dispose of all waste products such as packing materials, worn-out batteries, etc, according to local regulations
• Always check the obstruction detection system and safety devices for correct operation
• Neither Centurion Systems (Pty) Ltd, nor its subsidiaries, accepts any liability caused by improper use of the product, or for use other than that for which the automated system was intended
• This product was designed and built strictly for the use indicated in this documentation. Any other use, not expressly indicated here, could compromise the service life/operation of the product and/or be a source of danger
• Everything not expressly specified in these instructions is not permitted

- Never run the operator directly from the battery! Doing so will cause damage to the operator. Only run the operator from the V-Series Controller
- A moving gate can cause serious injury or death! Keep clear! The gate may move at any time! Do not allow children to play in the area of travel of the gate or operate the gate
This section has been left blank intentionally.
The **VERT-X** operator has been designed to safely and cost-effectively automate a domestic swing gate.

Combining an innovative open-nut drive system, advanced diagnostic capabilities and functionality, rugged die-cast aluminium construction and exceptional aesthetics for a wholly unobtrusive installation, **VERT-X** is positioned firmly at the apex of swing gate automation. In addition, the engineering team behind its design has invested considerable effort ensuring that the operator is as easy to install as it is powerful, and as reliable as it is good-looking.

The fail-safe and fully redundant position and collision detection system has been designed and tested to set the standard in safety of operation and to provide an unparalleled level of reliability and durability in operation.

The gate travel limits are managed by a sealed double-redundant opto-electronic system that has been designed not only to ensure ultra-reliable operation, but also to ensure precise position and trajectory control. This enables very accurate and reliable collision detection to ensure safe operation even under trying conditions.

The control card has been designed to be easy and intuitive to use with helpful instructions on the status of the operation during and after the installation. It also has a built-in diagnostic procedure that can verify every aspect of the control card onsite.

Some of the advanced features offered by the **V-Series Controller** are:

- Fully automated single-button Limit Setup for single and double swing gates
- Full graphics LCD display provides an intuitive user interface with built-in diagnostics to speed up and simplify the installation process
- Separate safety inputs for infrared beams on both the closing and opening directions of the gate
- Advanced closed-loop speed control to maintain safe and reliable operation of gates even under windy conditions
- Fully configurable gate Run Profiles
- Selectable and adjustable Autoclose with pushbutton override
- Pedestrian (Partial) opening with automatic closure
- Free-exit input
- Positive Open and Close Modes for gate locks and electric fence contacts
- Support for Inward and Outward opening gates
- Multiple Modes of Operation
- Solenoid lock drive output up to 2A
- Holiday Lockout
- A status LED output to indicate the gate status remotely
- Pillar Light control
- Leaf delay is selectable for either gate leaf
- Onboard code-hopping receiver with selective adding and deleting of remotes
2. Icons Used in this Manual

This icon indicates tips and other information that could be useful during the installation.

This icon denotes variations and other aspects that should be considered during installation.

This icon indicates warning, caution or attention! Please take special note of critical aspects that MUST be adhered to in order to prevent injury.

3.4. Lightning Protection

The V-Series electronic controller utilises the same proven surge protection philosophy that is used in all our products. While this does not guarantee that the unit will not be damaged in the event of a lightning strike or power surge, it greatly reduces the likelihood of such damage occurring. The earth return for the surge protection is provided via the mains power supply earth. In order to ensure that the surge protection is effective, it is essential that the unit is properly earthed.

3.5. Maximum Allowable Gate Mass and coverage

- Spanners 17mm/15mm preferably socket set
- Electric drilling machine
- Screwdrivers 3.5mm Flat
- Pliers
- Hole saw 20mm
- Measuring tape
- VERT-X Mounting Template Kit (Optional)
- VERT-X ABS Template
- T30 torx drive and Bit
- Connector block
- Crimping tool and Pin lugs
- Ø12mm masonry drill bit for wall mount bracket
- Ø6.5mm steel drill bit for Gate Bracket
- Hacksaw
- Angle grinder
- Pin punch 6mm
- Spirit level
- Extension cord
- Soldering iron
- Hacksaw
- Pin punch 6mm
- Soldering iron
- Safety equipment (goggles, gloves etc.)

FIGURE 4

SECTION 5 REQUIRED TOOLS & EQUIPMENT
6. Preparation of Site

6.1. General Considerations for the Installation:

Always recommend the fitment of additional safety equipment such as safety edges and Safety Beams (i5 or Photon), for additional protection against entrapment or other mechanical risks

Check that no pipes or electrical cables are in the way of the intended installation

Check that enough space is available for the gate operator with the gate in the required open position (see Figure 6)

If the swing gate leaf is longer than 2.5 metres, ensure that an electric lock can be fitted

For security reasons, never fit an operator on the outside of the gate, where the public has access to it (refer to the instructions for an Outward-opening swing gate)

Never run an operator directly off the 12V battery

Install the gate operator only if:

- It will not pose a hazard to the public
- There is sufficient clearance to a roadway and/or public thoroughfares
- The installation will meet all municipal and/or local authority requirements once completed
- The gate mass, leaf width, allowable wind loading and application is within the operator specifications (refer to the specification tables)
- The gate is in good working order, meaning:
  - That it swings freely;
  - Does not move on its own if left in any position;
  - Each gate leaf is strong and rigid;
- Once installed, there is sufficient clearance between moving parts when opening and closing to reduce the risk of personal injury and entrapment
- Pushbuttons or Keyswitches, when required, must be positioned so that the gate is in line of sight of the operator

1. Electric locks are recommend for most swing gate installations where greater security and/or resistance to strong winds is required
6.2. Determine Gate Opening Angle

Use this procedure to accurately determine the gate opening angle:

6.2.1. Step 1

Close the gate and measure a distance of one metre from the centreline of the gate hinge.

Make a mark on the ground.

6.2.2. Step 2

Open the gate and measure a distance of one metre along the gate from the centreline of the gate hinge.

Make another mark on the ground.

Measure the distance on the ground between the two marks (Z).

Using this Z-Value, determine the gate opening angle from the table below.

6.2.3. Step 3

Gate opening angle based on Z-Value

<table>
<thead>
<tr>
<th>Z-Value from</th>
<th>To</th>
<th>Use gate swing angle of</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000mm</td>
<td>1133mm</td>
<td>60° - 69°</td>
</tr>
<tr>
<td>1147mm</td>
<td>1272mm</td>
<td>70° - 79°</td>
</tr>
<tr>
<td>1286mm</td>
<td>1402mm</td>
<td>80° - 89°</td>
</tr>
<tr>
<td>1414mm</td>
<td>1475mm</td>
<td>90° - 95°</td>
</tr>
<tr>
<td>1486mm</td>
<td>1532mm</td>
<td>96° - 100°</td>
</tr>
</tbody>
</table>

Z-Values greater than 1532mm

1. The VERT-X operator is designed for a maximum gate opening angle of 100°.
6.3. Key Terms Used in this Section

6.3.1. Pillar maximum
The maximum allowable distance measured from the centre of the gate hinge to the edge of the pillar.

6.3.2. Wall minimum
This value denotes the minimum amount of space needed to install the operator and is measured from the side wall to the gate when the gate is in the open position.

6.4. Inward Opening Installation - 90° or less

Figure 6 shows the minimum wall clearance and maximum pillar to gate hinge point distance for an inward opening gate leaf opening to an angle of 90° or less.

The pillar to gate hinge point maximum ensures that the operator does not foul against the pillar when installed. The minimum wall clearance ensures that there is enough space to install the operator according to the installation tables.

**FIGURE 6. SIDE WALL LIMITATION FOR A 90° INWARD OPENING GATE**
6.5. Inward Opening Installation - 100°

Figure 7 shows the minimum wall clearance and maximum pillar to gate hinge point distance for an inward opening gate leaf opening to an angle of 100°.

The pillar to gate hinge point maximum ensures that the operator does not foul against the pillar when installed. The minimum wall clearance in the case of the 100° opening ensures that the gate does not run into the wall.

- For gates 1.0m to 2.0m long, the minimum wall clearance is 370mm
- For gates 2.0m to 3.0m long, the minimum wall clearance is 540mm

![FIGURE 7. SIDE WALL LIMITATION FOR A 100° INWARD OPENING GATE](image-url)
### 6.6. Hinge Depth on Gate

Due to the operator body being a fixed length and the operator body extending past the maximum travel position of the Gate Bracket pin, the operator can foul against the gate during operation if the unit is not installed correctly. Before installing the operator, ensure that the hinge depth in relation to the gate face is no more than 30mm.

This will ensure that the front end of the operator does not foul against the gate (see Figure 9.)

A gate hinge depth greater than 30mm will reduce the E-value (refer to Section 9) of the installation which, in turn, may result in the operator fouling against the gate during operation. In the unlikely event that a hinge depth greater than 30mm is measured (most gates will have a hinge depth of less than 30mm, with the exception of gates made from very thick material), the hinges must be ground off and repositioned so as to ensure the hinge point is less than 30mm from the gate face.
6.7. Wall Bracket Mounting Methods

For reliable operation, it is important to ensure that the way the operator is secured to the wall takes into account the strength of the pillar, the size of the gate and how frequently the gate will be used.

6.7.1. Through-Wall

Applications:
- Pre-fabricated walling
- For heavy gates operating frequently, use this method

6.7.2. Chemical Anchors

Applications:
- Masonry pillars
- Frequently use

6.7.3. Welding

Application:
- Steel pillars
6.7.4. Sleeve Anchors

Applications:
- Lighter gates
- Domestic

![Figure 13. Sleeve Anchors](image)

6.7.5. Rawl bolts

Applications:
- Lighter gates
- Domestic

![Figure 14. Rawl Bolts](image)
6.8. Gate Bracket Mounting

6.8.1. Steel Gates

The Gate Bracket is designed to be welded onto the gate.

6.8.2. Non-Steel Gates

In the case where the gate is not manufactured from steel:

- Use a suitable bracket made up from steel so that the Gate Bracket can be welded to it and then fastened to the gate using an appropriate method, OR
- Another Wall Mounting Bracket can be purchased and then the Gate Bracket can be welded to it as shown in Figure 16.
7. Cabling Requirements

Legend

1. 90V - 240V AC mains cable via mains isolator\(^1\) switch (3 core LNE 0,5mm\(^2\))^2, or low-voltage 16V AC battery charger supply\(^3\) (2 core 1,5mm\(^2\)).

2. Intercom cable (n1 + 6 core) to house.

3. Master motor (MTR M) or Slave motor (MTR S) cable. (Minimum, 2 core 1.5mm\(^2\) + 4 core 0,22mm\(^2\) multi-stranded)^4.

4. Optional radio receiver cable (3 core 0,5mm\(^2\) multi-stranded, optional)^5.

5. Optional Pedestrian Keyswitch (2 core 0,5mm\(^2\) multi-stranded) or optional keypad (3 core 0,5mm\(^2\) multi-stranded).

6. Optional, but recommended Infrared Safety Beams (3 core 0,5mm\(^2\) multi-stranded or 4 core 0.5mm\(^2\) for CE compliance).

7. Optional intercom cable (n2 + 2 core 0,5mm\(^2\) multi-stranded) to gate station.

8. Optional electric lock (2 core 0.5mm\(^2\)).

9. Optional Pillar Light cable (3 core, size according to power regulations).

10. Optional ground loop for free-exit (1 core 0.5mm\(^2\) multi-stranded - silicone-coated)^6.

1. As per SABS/IEC 10142 Electrical Regulations the mains isolator must be fitted less than 1.5m from the controller

2. Increase cable thickness if Pillar Lights are to be installed

3. Screened cable is always recommended to provide better protection against lightning - earth one end of screening

4. Please use V-Series cabling. Order reference: CABLEVEC68

5. For optimum range an external receiver can be mounted on the wall

6. Consult manufacturer of loop detector for specific details

- All cables must be routed in conduit unless underground cable is being used
- Mains isolator must be less than one metre from the operator
- Safety Beams are always recommended
8. Critical Installation Checklist

The following is a list of critical requirements that must be adhered to in order to ensure reliable operation of your VERT-X operator(s):

- Ensure that the Wall Bracket is securely anchored
- Make sure that the operator’s maximum stroke is being utilised
- Only use V-Series cable for the installation
- Leave a 350mm long loop in the cable close to the operator. See Figure 17
- Fit an electric gate lock if the gate leaf width is greater than 2.5 metres
- Ensure that the opening and closing angles conform to the installation guidelines
- Ensure that your gate and operator(s) are equipped to deal with Wind Loading (refer to the Table 4 on page 14)

Never run the operator directly from the battery! Doing so will cause damage to the operator and invalidate the warranty. Only run the operator from the V-Series Controller.
9. Operator Installation-Inward Opening Gate

9.1. Key Terms Used in this Section

**A-Value:** The horizontal distance from the pivot point on the Wall Bracket to the gate hinge point

**B-Value:** The vertical distance from the pivot point on the Wall Bracket to the gate hinge point

**C-Value:** The horizontal distance from the gate hinge point to the Gate Bracket pivot point

**D-Value:** The distance from the gate center line to the pivot point on Gate Bracket welded assembly

**E-Value:** The distance from the face of the gate to the pivot point on the Gate Bracket welded assembly

9.2. Installation Tables - Inward Opening

Use the following installation tables to determine the best geometry for the installation.

**VERT-X Inward Opening Geometry Tables:**

**90° Inward Opening Gate**

1. Optimum Installation

With this type of operator, it is critical to choose the correct installation position from the installation tables to ensure that the tip of the operator does not interfere with the gate during operation.
9.3 Physical Installation - Inward Opening

9.3.1. Step 1: Determine the Gate Bracket Length (E-Value)

It is essential to first determine whether the correct Gate Bracket length (E-Value) can be achieved according to Table 9 (Installation Table) as described below.

**Example for a 90° Inward Opening Installation**

Measure the hinge depth from the centre of the hinge point to the face of the gate. If the hinge depth is greater than 30mm, then refer to Section 6.6. For this example, a measurement of 25mm will be used.

\[
E\text{-Value} = D\text{-Value} - \text{Hinge Depth}
\]

Thus: \(E\text{-Value} = 110\text{mm} - 25\text{mm} = 85\text{mm}\).

If the E-value is greater than 85mm, you may choose any installation position shown in Table 6.

If the E-Value is less than 80mm (for 90° inward opening) or less than 77.5mm (for 100° inward opening), the operator WILL foul against the gate during operation as shown in Figure 9. In order to rectify this, refer to Section 6.6.
9.3.2. Step 2: Wall Bracket Height

Determine a suitable height for the Wall Bracket.

Be aware that the Wall Bracket is mounted 35mm higher than the Gate Bracket. If the gate has limited cross-bars to which the Gate Bracket can be attached, then this will determine the height of the Wall Bracket.

9.3.3. Step 3: Mounting the Wall Bracket

9.3.3.1. Determine the Wall Bracket Length

From Figure 18 and Table 6 find the corresponding B-Value for the installation determined in Section 9.3.1.

Using a steel ruler (tape measure) or the VERT-X ABS template (which can be purchased as an optional extra, determine the Wall Bracket length.

For the steel ruler option, this is achieved by placing the steel ruler with the 0mm marking at the gate hinge point and measuring out the B-Value. The Wall bracket length is then the difference between the B-Value and the distance to the pillar face. This is shown in Figure 21.

For the VERT-X ABS template option, place the correct B-Value measurement at the gate hinge point. The Wall Bracket length is determined by measuring the distance from the horizontal line on the template to the pillar face. This is shown in Figure 22.
9.3.3.2. Cut and Weld the Wall Bracket

Mark the determined length on the Wall Bracket.

Measure the determined length from the centre of the hole.

Cut off excess length.

Insert the Wall Bracket into the mounting plate.

Weld the brackets together.

9.3.4. Step 4: Mounting the Wall Bracket Assembly

From Figure 18 and Table 6 find the corresponding A-Value for the installation determined in Section 9.3.

Using a steel ruler (tape measure) or the VERT-X ABS template, determine the mounting position of the Wall Bracket.

Ensure that the measurement is taken to the centre of the hole as shown in Figures 24 and 25.

Mark the Wall Bracket in the correct position on the wall and then mount it using the preferred mounting method as discussed in Section 6.5.
9.3.4.1. Cutting the Gate Bracket

Determine the E-Value for this specific installation by following the example in section 9.3.1 and substituting the hinge depth of this specific installation into the calculation.

Cut the Gate Bracket to the E-Value length in order to mount the bracket to the gate and achieve the correct D-Value.

The measurement is taken from the centre of the hole of the Gate Bracket as indicated in Figure 26.

9.3.4.2. Making Up a Bracket for a Non-steel Gate

In the case where the gate is not manufactured from steel or the mounting point for the front bracket is not on a steel section of the gate, it is necessary to make up a mounting bracket for the Gate Bracket. This is easily achieved by purchasing a second Wall Mounting Bracket and welding the Gate Bracket to the Wall Bracket Mounting Plate.
9.3.5. Step 5: Mounting the Gate Bracket

Although the installation is easier when using the VERT-X Metal Template (which can be purchased as an optional extra), it is possible to install the unit without the use of the template.

9.3.5.1. VERT-X Metal Template

From Figure 18 and Table 6 find the corresponding C-Value for the installation determined in Section 9.3.1.

Close the gate leaf and mark the C-Value distance along the gate leaf (measured from the Gate Hinge Point).

Refer to Figure 28 for details.

- The operator should never be run manually directly off of a battery! Doing so and driving the operator into an endstop will result in serious damage being sustained by the worm drive
- Never lubricate the worm drive

Mount the operator to the Wall Bracket and, using a spirit level, level the operator and determine the height of the Gate Bracket. Mark the height of the Gate Bracket.
Remove the operator and then fix the Gate Bracket onto the gate using the preferred mounting method.

9.3.5.2. Using the Metal Template (Optional Extra)

Using the Metal Template available and the Gate Bracket Pin:

---

FIGURE 30. ATTACH THE GATE BRACKET ONTO A STEEL GATE

FIGURE 31. MOUNT THE GATE BRACKET
• Mount the template to the Wall Bracket using the bracket pin
• Rest the spirit level on the template and level the template
• Holding the Gate Bracket underneath the template (as shown in Figure 31), insert the pin through the slot in the template and into the Gate Bracket
• With the gate in the closed position, move the Gate Bracket to the end of the slot of the metal template
• Spot weld the Gate Bracket in place OR make the necessary markings if a Bracket has been made up to fit a non-steel gate
• To avoid damage, it is recommended that the Metal Template be removed before the Gate Bracket
• Fix the Gate Bracket onto the gate using the preferred mounting method as discussed in Section 6.6

It is advisable to first check that the installation works before permanently fixing the brackets in place. See section 9.7.
9.3.6. Step 6: Check the Installation if you have the Metal Template

With the Metal Template mounted to the gate as per Section 9.3.6.2., swing the gate leaf to the open position. If it is possible to open the gate to the required open position without the template fouling against the gate pillar or gate, and the Gate Bracket Pin travels within the slot of the Metal Template without fouling, then the installation of the brackets is deemed to be correct.

If you do not have the Metal Template, make sure that the spot welds are sufficient to take a significant load as back-driving the unit through the gearbox in the override condition requires a large force when the unit is new out of the box.
9.3.7. Step 7: Mount the Operator

With the brackets now fully fitted, the operator can be mounted onto the brackets.

If the unit is mounted onto the brackets and the gate is not in the fully closed position, manually override the unit and move the gate into the closed position.

It may be necessary to adjust the endstops to get to the fully closed and open positions. See section 9.9 for adjusting the endstops.

To place in Manual Override:

- Open the camlock lid to access the override key slot;
- Insert the key and rotate 180°;
9.3.8. Step 8: Adjusting the Endstops

Ensure that the gate is in the fully closed position.

Slightly loosen the Torx screws on front endstop and adjust the endstop so that it sits up against the pivot bracket of the operator. Tighten the Torx screws in this position.

If the gate has mechanical endstops in the closed position, there is no need to adjust the front endstop on the operator.

With the unit still in the override condition, move the gate leaf into the required open position and adjust the rear endstop in the same way. Once the endstop has been adjusted, close the gate leaf, re-engage the unit and remove the keys. The unit is now ready to be connected to the controller.

- The operator should never be run manually directly off a battery! Doing so and driving the operator into an endstop will result in serious damage being sustained by the worm drive
- Never lubricate the worm drive
10. Operator Installation-Outward Opening Gate

- The installation guidelines shown below include the use of the VERT-X ABS template and the VERT-X metal template
- The installation can still be performed without these templates by using a tape measure and spirit level

10.1. Key Terms Used in this Section

A-Value: The horizontal distance from the pivot point on the Wall Bracket to the gate hinge point

B-Value: The vertical distance from the pivot point on the Wall Bracket to the gate hinge point

C-Value: The horizontal distance from the gate hinge point to the Gate bracket pivot point

D-Value: The distance from the gate center line to the pivot point on Gate Bracket welded assembly

E-Value: The distance from the face of the gate to the pivot point on the Gate Bracket welded assembly

10.2. Installation Tables - Outward Opening

In most cases it will be necessary to make up a suitable extension bracket on which to mount the operator’s Wall Bracket.
Use the following installation tables to determine the best geometry for the installation.

**VERT-X Outward Opening Geometry Tables:**

**90° Outward Opening Gate**

</tbody>
</table>

1. Optimum Installation

---

Values- A, B, & C are measured from the gate hinge point.

Value- D is measured from the gate hinge point centre line.

Value-E is measured from the gate face to the Gate Bracket centre point.

---

With this type of operator, it is critical to choose the correct installation position from the installation tables to ensure that the tip of the operator does not interfere with the gate during operation.
10.3. Physical installation - Outward opening

10.3.1. Step 1: Determine the Gate Bracket Length (E-Value)

It is essential to first determine whether the correct Gate Bracket length (E-Value) can be achieved according to Table 8 and 9 (Installation Table) as described below.

The most optimal installation position for a VERT-X 90° outward opening is:

- A = 160
- B = 140
- C = 638
- D = 115

Therefore this installation position will be described in this Manual. (Refer to Figure 38 and Tables 8 and 9 for details).

Measure the hinge depth from the centre of the hinge point to the face of the gate. If the hinge depth is greater than 30mm, then refer to Section 6.6. (for this example, a measurement of 25mm will be used).

E-Value = D-Value MINUS Hinge Depth

Thus: E = 115mm – 25mm = 90mm

If the E-value is greater than 82.5mm, you may choose any installation position shown in Table 6 (see note above for optimal installation).

If the E-Value is less than 80mm (for 90° outward opening) or less than 85mm (for 100° outward opening), the operator WILL foul against the gate during operation. In order to rectify this, refer to Section 6.4.
10.3.2. Step 2: Wall Bracket Height

Determine a suitable height for the Wall Bracket.

Be aware that the Wall Bracket is mounted 35mm higher than the Gate Bracket. If the gate has limited cross bars to which the Gate Bracket can be attached then this will determine the height of the Wall Bracket.

In most outward opening installations, a custom bracket will have to be made up by the installer. The VERT-X Wall Bracket is then attached to this custom bracket.

10.3.3. Step 3: Mounting the Wall Bracket

10.3.3.1. Determine the Wall Bracket Position

Find the corresponding A-Value and B-Value for the installation determined in Section 10.3.

Using a steel ruler (tape measure) or the VERT-X ABS template (which can be purchased as an optional extra), determine the Wall Bracket length.

For the steel ruler option, this is achieved by placing the steel ruler with the 0mm marking at the gate hinge point and measuring out the B-Value. The Wall bracket length is then the difference between the B-Value and the distance to the pillar face. This is shown in Figure 40.

For the VERT-X ABS template option, place the correct B-Value measurement at the gate hinge point. The Wall Bracket length is determined by measuring the distance from the horizontal line on the template to the pillar face. This is shown in Figure 41.
10.3.3.2. Make Up and Mount the Custom Bracket

For an outward swing installation, the rear hinge point for the operator needs to be on the inside of the gate hinge. It may be necessary to make up a custom bracket for the installation if it is not possible to mount the bracket to the wall in the case where the side wall is close enough to achieve the correct A-Value. After determining the correct position of the Wall Bracket in Section 10.3.3.1., make up a custom bracket that will securely hold the Wall Bracket in this position as shown in Figure 42A & 42B.

10.3.3.3. Cut, Weld and Mount the Wall Bracket

Mark the determined length on the Wall Bracket.

Measure the calculated length from the centre of the hole as indicated in Figure 43.

Cut off excess length.

Insert the Wall Bracket into the mounting plate.

Weld the brackets together.
Mount the Wall Bracket in the correct position onto the wall using the preferred method as discussed in Section 6.5 or mount it to the custom bracket as shown in Figure 44.

10.3.4. Step 4: Cutting the Gate Bracket

Determine the E-Value for this specific installation by following the example in section 10.3.1 and substituting the hinge depth of this specific installation into the calculation.

Cut the Gate Bracket to the E-Value length in order to mount the bracket to the gate and achieve the correct D-Value.
10.3.4.1. Making Up a Bracket for a Non-steel Gate

In the case where the gate is not manufactured from steel or the mounting point for the front bracket is not on a steel section of the gate, it is necessary to make up a mounting bracket for the Gate Bracket. This is easily achieved by purchasing a second Wall Mounting Bracket and welding the Gate Bracket to the Wall Bracket Mounting Plate. See section 6.6.2

![Diagram: Mounting Bracket for Non-steel Gate](image)

FIGURE 46. ATTACH THE GATE Bracket ONTO A NON-STEEL GATE

10.3.5. Step 5: Mounting the Gate Bracket

Although the installation is easier when using the VERT-X Metal Template (which can be purchased as an optional extra from Centurion Systems), it is possible to install the unit without the use of the template.

10.3.5.1. Without Template

Find the corresponding C-Value for the installation determined in Section 10.2.

Close the gate leaf and mark the C-Value distance along the gate leaf (measured from the centre of the gate hinge).

Refer to Figure 47 for details.

![Diagram: Marking the C-Value](image)

FIGURE 47. MARK THE C-VALUE
Mount the operator to the Wall Bracket and, using a spirit level, determine the height of the Gate Bracket. Mark the height of the Gate Bracket.

FIGURE 48. MARK THE GATE BRACKET HEIGHT
Remove the operator and then fix the Gate Bracket onto the gate using the preferred mounting method.

![Diagram of gate hinge and C-value](image)

**FIGURE 49. ATTACH THE GATE BRACKET IN PLACE**

- The operator should never be run manually directly off a battery! Doing so and driving the operator into an endstop will result in serious damage being sustained by the worm drive.
- Never lubricate the worm drive.
10.3.5.2. Using the Metal Template (Optional Extra)

Using the Metal Template available and the Gate Bracket Pin:

- Mount the template to the Wall Bracket using the Bracket Pin
- Rest the spirit level on the template and level the template
- Holding the Gate Bracket underneath the template (as shown in Figure 50), insert the Pin through the slot in the template and into the Gate Bracket
- With the gate in the closed position, move the Gate Bracket to the near end of the slot
- Spot weld the Gate Bracket in place OR make the necessary markings if a bracket has been made up to fit a non-steel gate
- To avoid damage it is recommended that the Metal Template be removed before the Gate Bracket
- Fix the Gate Bracket onto the gate using the preferred mounting method.

It is advisable to first check that the installation works before permanently fixing the brackets in place. See Section 10.7.
10.3.6. Step 6: Check the Installation if you have the Metal Template

With the metal template mounted to the gate as per Section 10.6.2., swing the gate leaf to the open position. If it is possible to open the gate to the required open position without the template fouling against the gate pillar or gate, and the Gate Bracket Pin travels within the slot of the metal template without fouling, then the installation of the brackets is deemed to be correct.

If you do not have the Metal Template, make sure that the spot welds are sufficient to take a significant load as back-driving the unit through the gearbox in the override condition requires a large force when the unit is new out of the box.
10.3.7. Step 7: Mount the Operator

With the brackets now fully fitted, the operator can be mounted onto the brackets.

If the operator is mounted onto the brackets and the gate is not in the fully closed position, manually override the unit and move the gate into the closed position.

It may be necessary to adjust the endstops to get to the fully closed and open positions. See section 10.9 for adjusting the endstops.

To place in Manual Override:

- Open the camlock lid to access the override key slot;
- Insert the key and rotate 180°;
10.3.8. Step 8: Adjusting the Endstops

Ensure that the gate is in the fully closed position. Slightly loosen the Torx screws on the back endstop and adjust the endstop so that it sits up against the pivot bracket of the operator. Tighten the Torx screws in this position.

If the gate has mechanical endstops in the closed position there is no need to adjust the nearest endstop on the operator.

With the unit still in the override condition, move the gate leaf into the required open position and adjust the front endstop in the same way. Once the endstop has been adjusted, close the gate leaf, re-engage the unit and remove the keys. The unit is now ready to be connected to the controller.

- The operator should never be run manually directly off a battery! Doing so and driving the operator into an endstop will result in serious damage being sustained by the worm drive
- Never lubricate the worm drive
