

# enhance your D3/D5 gate installation

## P36 Passive Sensitive Edge

*It has become the modus operandi of would-be intruders to hold open an entrance gate by covering up the system infrared safety beams.*

*Enhanced security features such as automatic closing, designed to ensure the gates will always close, are not recommended without the use of safety beams. The detection of pedestrian or vehicle traffic through the gate is also affected and therefore the incidence of gates closing on an obstruction is increased. What is the solution? The CENTURION P36 Passive Sensitive Edge.*

*The P36 is a custom extruded rubber buffer that is simply secured to the leading edge of the gate requiring no electrical connection to the operator. Besides not being able to override the edge and hold open the gate, the P36 minimizes the damage caused by a gate closing on a vehicle or person.*
